

APPLE POLLINATION

- An apple variety can generally be pollinated by any other variety **in the same or an adjacent column.**
- Apples marked with an 'S' are partially self-fertile varieties that will often produce enough fruit for the home gardener without a pollinator. A second tree to enhance pollination will increase production.
- Sterile pollen varieties are marked with a "T" for triploid. Sterile varieties must be pollinated by a variety that is not sterile. They cannot pollinate another variety, so it is best to choose a self-fertile variety for pollination.
- Crabapples can also pollinate apples as long as they bloom at the same time. Information on four varieties has been provided.

EARLY	EARLY - MID	MID - LATE	LATE
Amere de Berthecourt	Ashmead's Kernal	Akane - S	Belle de Boskoop
Chehalis - S	Cortland	Arkansas Black - T	Calville Blanc
Discovery	Empire	Braeburn - T	Enterprise
Early Pink Lady-S	Fireside	Cox's Orange - S	Fuji
Garden Delicious-S	Freedom	Criterion	Granny Smith-S
