

EUROPEAN PEAR VARIETIES

For the home garden pears are thought to be among the most manageable trees, as well as being prized for their ornamental value. Pears are also more tolerant of heavy, wet soils than most fruit trees, making them a good choice for western Oregon.

ANJOU	Large, conical, light green fruit with mild, fine textured, melting white flesh. Best after 2 months in cold storage. Ripens late September.
BARTLETT	Semi self-fertile , but higher yields with another variety (Except Seckel). Large, golden yellow fruit with a red blush. Smooth, juicy white flesh. Mid-Aug to mid-September.
BOSC	Med-large, deep yellow fruit. Tender, aromatic, juicy, fine textured, white flesh with rich, slightly acid flavor. Ripens early October.
BUTIRRA PRECOCE MORETTINI	One of the best early varieties, with meltingly juicy, sweet, white flesh. Vigorous, heavy bearer, ripens 20 days before Bartlett. Good keeper too. Early August.
COMICE	Blushing yellow fruit with juicy, firm, fine-textured flesh. Premium dessert pear, ripens late Sept. Best after a month in cold storage.
MAXIE	Euro-Asian hybrid with delicious, aromatic, round, red-yellow fruit and crisp, sweet flesh. Ripens Mid-September and is best for fresh eating.
RED ANJOU	Identical in every way to standard Anjou, but with a deep red skin color that deepens as it ripens. Sweet, mild flavor that peaks two weeks after picking. Great keeper at up to 8 months!
RED BARTLETT	A red sport of Bartlett with brown-red fruit maturing to bright red. Similar to Bartlett in most ways, but tree tends to be smaller. Mid-Aug. to mid-Sept.
RESCUE	Self-fertile . Large to extra-large, elongated, yellow fruit blushed and striped in vivid orange and red. Creamy, buttery flesh with mild, sweet flavor and small core. Ripens Sept. and keeps into Dec.
SECKEL	Self-fertile , but produces better crops if cross pollinated. (Cannot cross with Bartlett). Small, yellow-brown fruit with extremely sweet, very juicy flesh. Distinctive, rich, spicy flavor. Excellent all-purpose.
UBILEEN	Yellow skin blushed red, with buttery, flavorful flesh. Vigorous, disease resistant variety from Bulgaria. Ripens early to mid-July.

NOTE: Although the blossoms are attractive to people, they are relatively unattractive to bees. Therefore pears should be planted next to each other, about 15' apart, for better pollination and production.

Late blooming Asian pears may pollinize early blooming European pears, if their bloom time overlaps. 20th Century and Shinko are good candidates.

BLOOM ORDER

Early	Mid	Late
Aurora	Anjou	Bosc
Bartlett	Colette	Comice
Butirra P. M.	Conference	Seckel
Highland	Flemish Beauty	
Maxie	Reddy Robin	
Moonglow	Red Anjou	
Red Bartlett		
Ubleen
